

ABSTRACT OF THE DISCLOSURE

A system and devices for transferring and storing digital files from a local host to a remote host using a PSTN network to communicate at a time predetermined and preset by the recipient. A local device accepts data files from a local host, stores them until a
5 predetermined and preset time and then uses a modem to contact a remote device. Once the local device has contact the remote device, the data files are transferred to the remote device. A remote host, connected to the remote device, can then access the data files from the remote device.
